Building Reports, Dashboards, and Custom Pages (UI Builder) for the Application

Event Registration Form — Reporting & Dashboard Use Case

SAMYUKTHA.B

241401091

1. Aim

Tobuildmultiple report views — a Kanban report grouped by Event Track and a Calendar report for tracking registration schedules — on top of the Event_Registration form, and to design a custom Admin Dashboard page using Zoho Creator's UI Builder (Page Builder) that gives the event organising team an at-a-glance view of total registrations, target capacity achieved, and track-wise participation.

This addresses the event team's need to move from a flat list of registrations to visual, role-friendly views that make it easy to see which track each participant has chosen, check the registration schedule at a glance, and monitor overall registration trends without opening every record individually.

2. Procedure

Step1:Create the Kanban report — A new report named Course_View was added on the Event_Registration form and its type was set to Kanban.

Step 2: Configure Kanban properties — In the Report Builder, Group Columns By was set to Event Track so each column represents one track (AI & Data Science Track, Development Track, Cybersecurity Track),

with the Empty Value Column and Deleted Value Column hidden and Record Count Per Column hidden for a clean board.

Step 3: Create the Calendar report — A second report, Registration_Schedule, was added and its type was set to Calendar to visualise registrations across a month/week/day grid.

Step 4: Configure Calendar properties — The Event title field was bound to Event Track, and both Event starts on / Event ends on fields were bound to Preferred_Session_Date, with the Default view set to Month and the week starting on Sunday.

Step 5: Open the Page Builder — A new custom page named Admin Dashboard was created for the application using Zoho Creator's Page Builder (UI Builder), which exposes a palette of elements — Panel, Board, Chart, Gauge, Search, Form, Report, Snippets, Button, Widgets, and Viewer.

Step 6: Embed the report grid — A Report element titled All Event Registrations was placed at the top of the page, listing every registration record in one place.

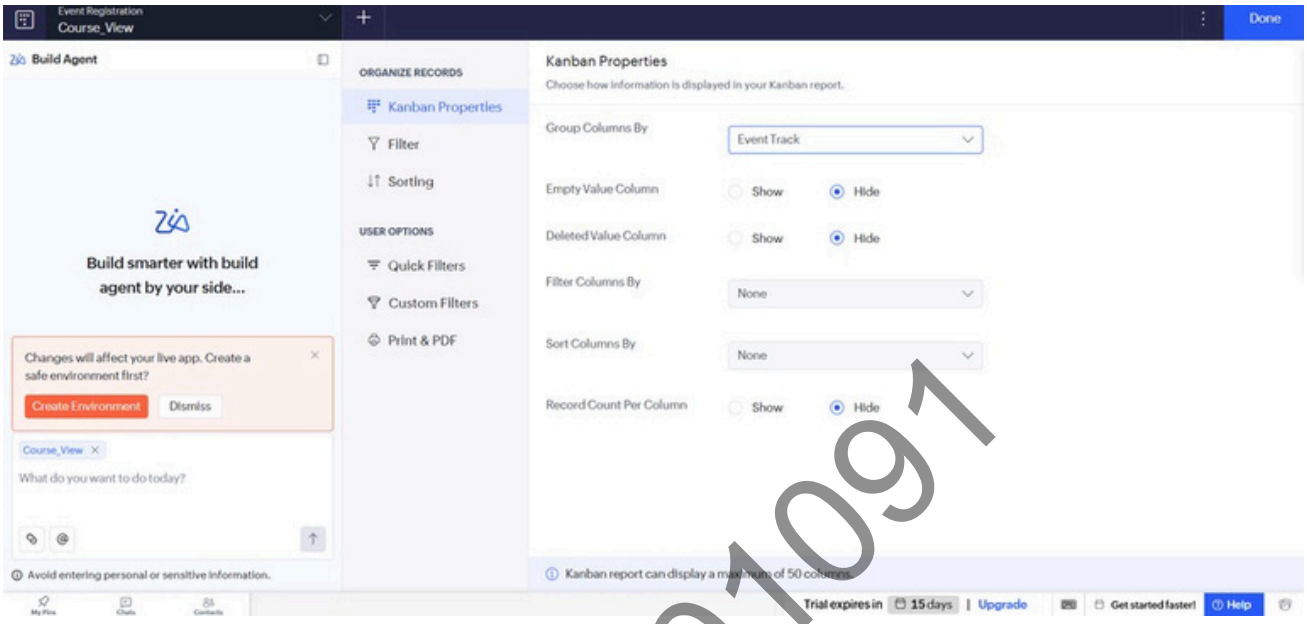

Step 7: Add summary panels — Two summary panels were added below the report — Total Registrations, showing the live count of records, and Target Capacity Achieved, showing the percentage of the registration target filled.

Step 8: Add chart widgets — Two Chart elements were added at the bottom of the page: a Column chart plotting registrations, and a Donut chart summarising registrations proportionally by track — giving the admin team a quick visual breakdown alongside the numeric figures.

3. Output

3.1ReportBuilder — Kanban Properties for "Course_View"

The Kanban Properties panel shows Group Columns By set to Event Track, with the Empty Value Column, Deleted Value Column, and Record Count Per Column all set to Hide for a clean board. This is where the track-wise grouping used in the live Kanban report is configured.

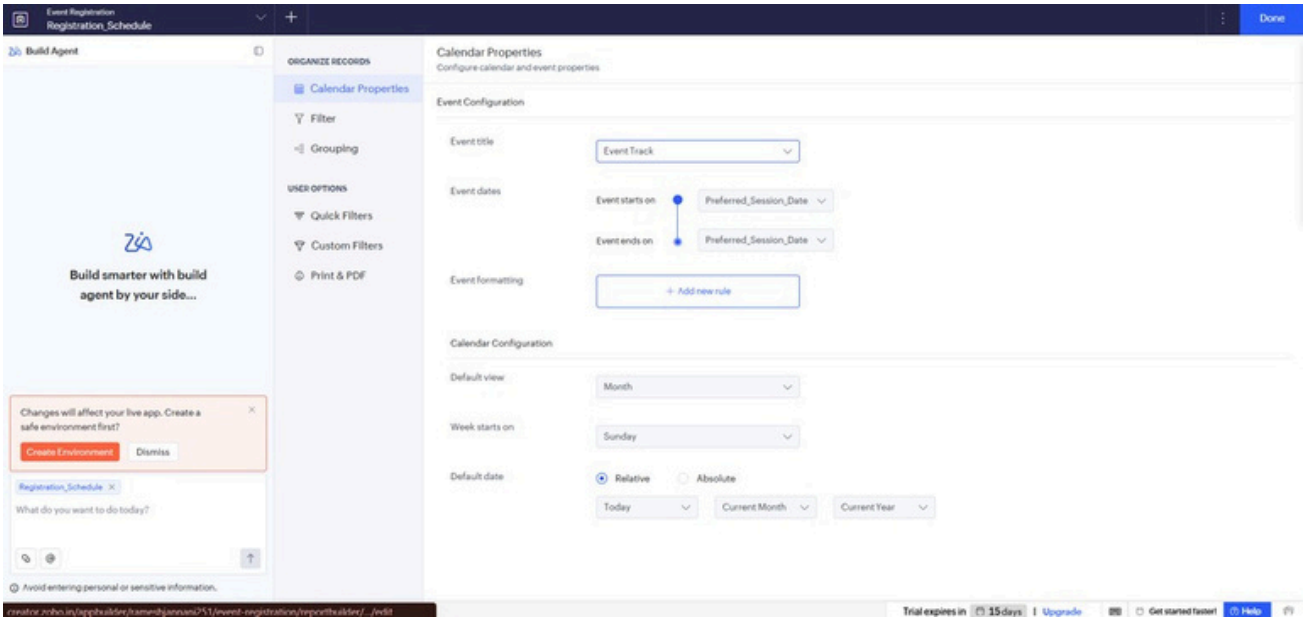

3.2 Live Kanban report — "Course_View"

The published Course_View report displays one column per event track, with each registered participant sitting under their chosen track. The AI & Data Science Track column shows participant Priya Venkatesan (Student), and selecting the record opens the full registration details — participant type, team size, contact information, institution, areas of interest, preferred session date and slot, and code-of-conduct agreement — confirming the grouping works as configured.

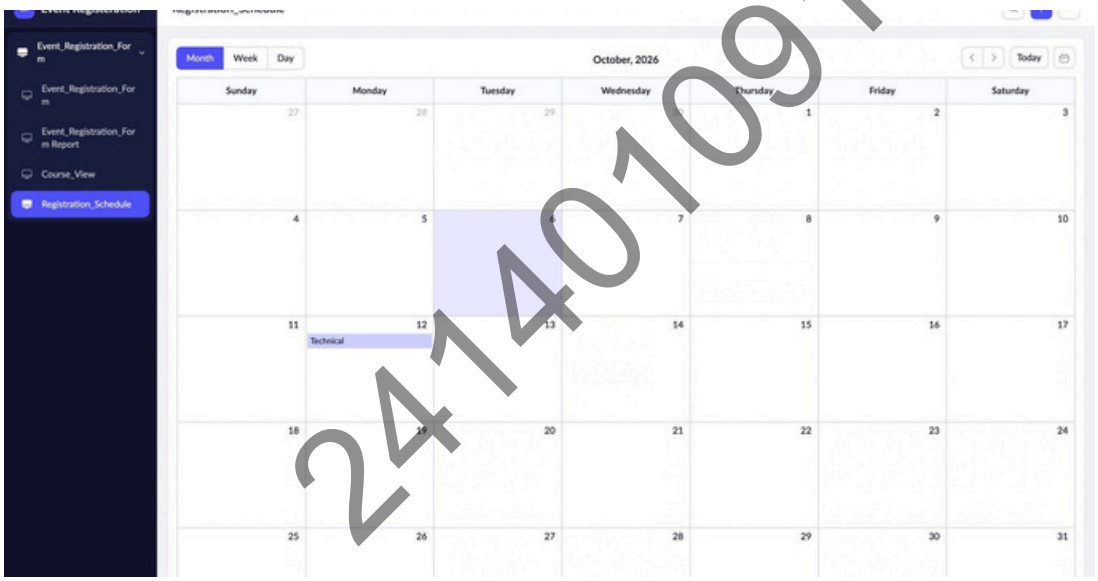

3.3 Report Builder — Calendar Properties for "Registration_Schedule"

241401091

The Calendar Properties panel binds the Event title field to Event Track, and both the Event starts on and Event ends on fields to Preferred_Session_Date, with the Default view set to Month and the week starting on Sunday. This configuration drives how each registration is plotted on the calendar grid.

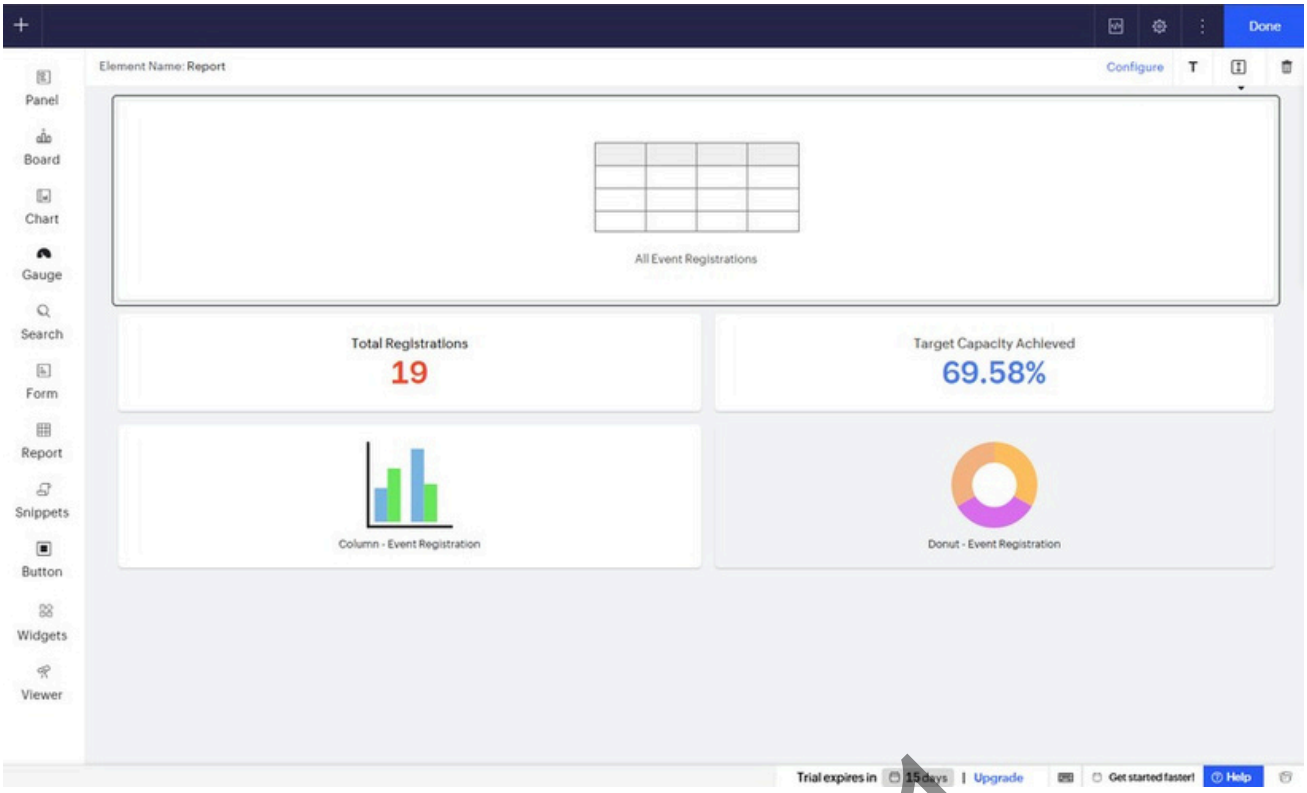

3.4 Live Calendar report — "Registration_Schedule"

241401091

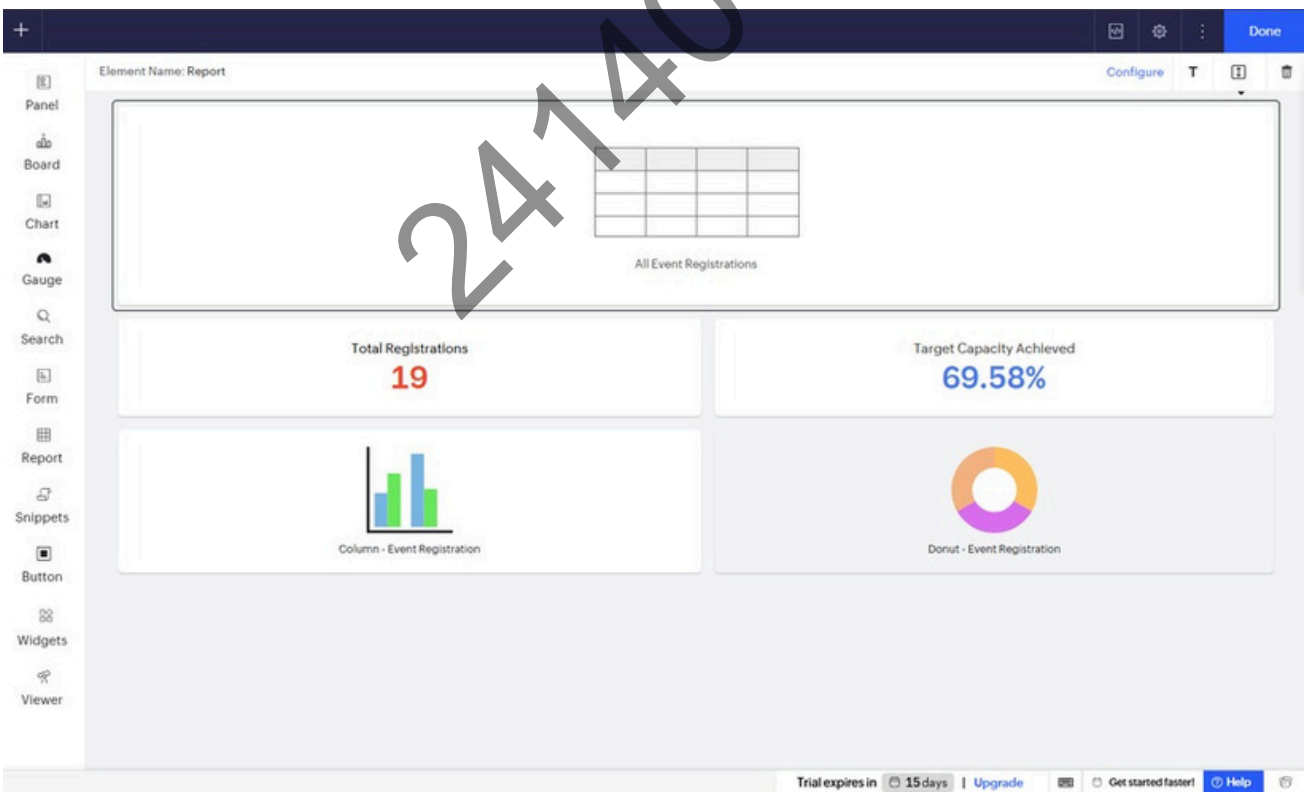

The published calendar shows September 2026 in Month view, with each registered track plotted directly on its preferred session date — AI & Data Science Track on the 12th, Development Track on the 13th, and Cybersecurity Track on the 14th. The sidebar also lists the other reports built on the form, including All Event Registrations and Course_View.

3.5 Page Builder (UI Builder) — Designing the Admin Dashboard

The Page Builder view shows the widget palette (Panel, Board, Chart, Gauge, Search, Form, Report, Snippets, Button, Widgets, Viewer) on the left, and the Admin Dashboard page under construction on the right: an embedded All Event Registrations report grid at the top, followed by two summary panels — Total Registrations (19) and Target Capacity Achieved (69.58%) — and two chart widgets, a Column chart and a Donut chart, both sourced from the Event Registration form.

3.6 Live custom page — "Admin Dashboard"

The rendered Admin Dashboard page pulls live data directly from the Event Registration form: the All Event Registrations report lists every submitted record, the Total Registrations panel shows a live count of 19, and the Target Capacity Achieved panel shows 69.58% of the registration target filled. The Column and Donut charts break

241401091

this same data down visually, giving the admin team a single-screen summary of registration activity across all tracks.

4. Final Result

Twoadditional report views were successfully built on the Event_Registration form: a Kanban report that groups registrations by Event Track for quick track-wise triage, and a Calendar report that plots every registration on its preferred session date for day-to-day scheduling.

A custom Admin Dashboard page was designed using Zoho Creator's UI Builder, combining an embedded report grid, two live summary panels — Total Registrations and Target Capacity Achieved — and a Column chart and a Donut chart into a single at-a-glance view of registration activity across all event tracks.

All views were verified in live/preview mode with real sample data, confirming that the Kanban grouping, calendar date-binding, and dashboard widgets render correctly and pull live records from the Event_Registration form.

The exercise met its objective: the event organising team now has three complementary, low-code views — grouped, scheduled, and summarised — built entirely without custom code, in place of scrolling through a single flat report.
