Building Reports, Dashboards, and Custom Pages (UI Builder) for the Application

Automated Business Workflow using Deluge Scripting — Event Registration Form

SAMYUKTHA.B
241401091

1. Aim

Todesignandimplement an automated business process workflow within the Zoho Creator application using Deluge scripting,andtosuccessfully conduct application testing and debugging to verify real-time execution.

Objectives

- To configure a form-level event trigger that automatically executes actions upon a successful record creation.
- To write custom backend logic using Deluge syntax to send automated email confirmations.
- To performend-to-end debugging and live testing to ensure data accuracy and workflow reliability.

2. Procedure

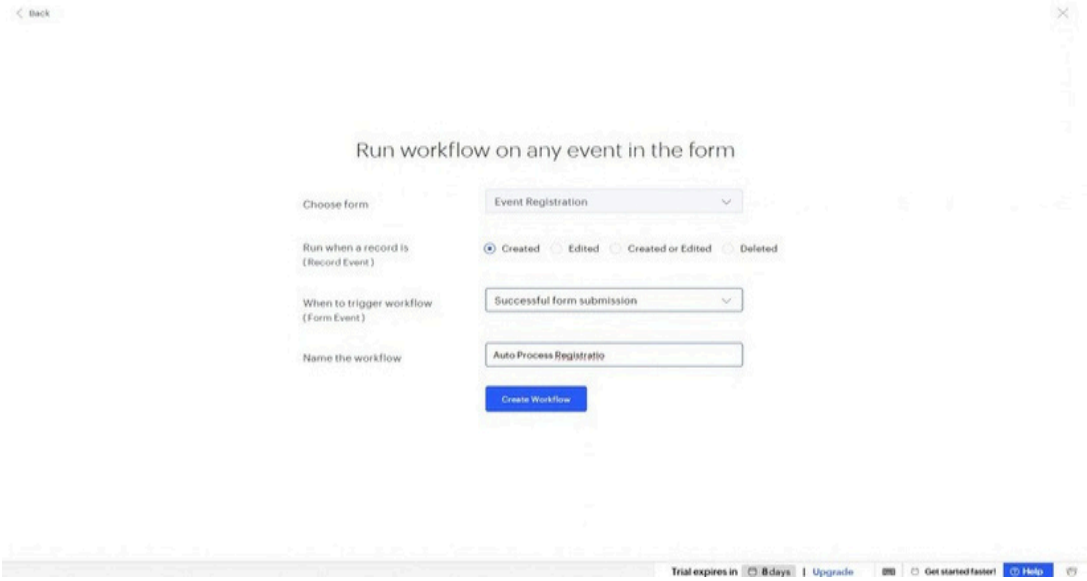

Step1: Initiating the Workflow Configuration

1. Open the Zoho Creator applicationinEditmode.
2. Select Workflows from the left-handnavigation panel.
3. Click on the Create New Workflowbuttontoopen the automation setup window.

Step2: Defining the Trigger Parameters

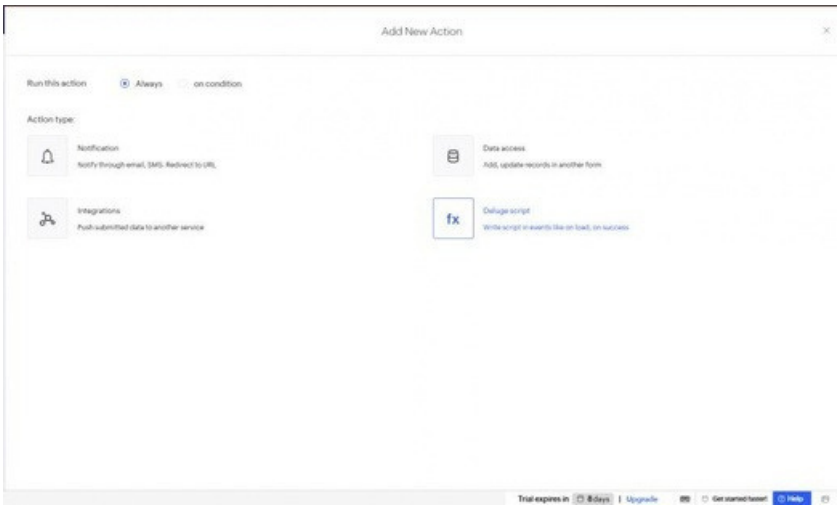

1. Under the Choose Form dropdown, select the target form: Event Registration.
2. For the Record Event condition, select Created to ensure the automation runs only when a brand-new registration entry is submitted.
3. For the Form Event condition, select Successful Form Submission to trigger the backend actions right after validation.
4. Name the workflow clearly as Auto Process Registration or Send Registration Email and click Create Workflow.

241401091

The workflow setup window shows the Event Registration form selected, the Record Event set to Created, the Form Event set to Successful form submission, and the workflow named Auto Process Registration, ready to be created with the Create Workflow button.

Step 3: Setting up the Action Interface

1. Insidethenewly created workflow diagram block, click the Add New Action button.
2. SelectDeluge Script from the available option panels to launch the cloud-based Deluge code editor workspace.

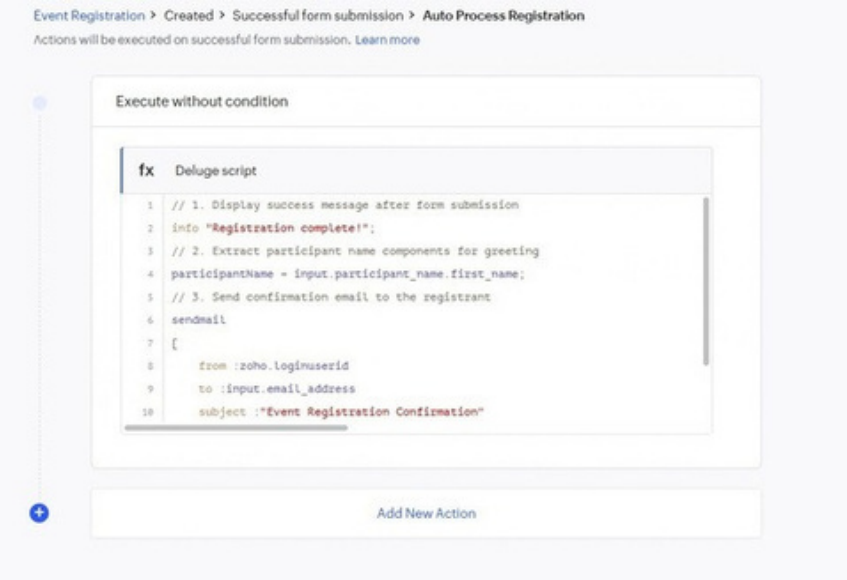

Step 4: Developing the Deluge Script

241401091

1. Write or configure the backend code inside the editor using Zoho's proprietary Deluge syntax.
2. Implement a sendmail function block using system variables (zoho.loginuserid) to establish secure routing between the sender and the recipient.
3. Define strict parameter pairs within the bracket block, ensuring correct spacing for tags (from:, to:, subject:, message:).

Step 5: Compiling and Saving

1. Reviewthecode to eliminate syntax errors, mismatched brackets, or missing string quotationmarks.
2. Clicktheblue Save button in the lower right corner to compile the code and successfully pushthe workflow script live.

Step 6: Executing Live Application Testing

241401091

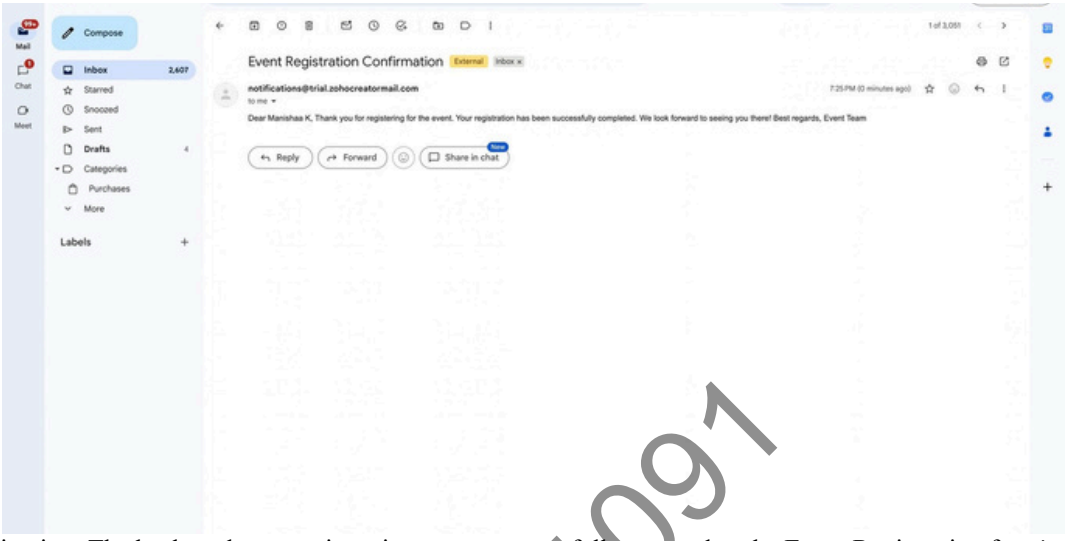

1. Switchtheapplication from the editor environment to the live User View.
2. OpentheliveEvent Registration form.
3. Populateallfields with mock data and input a valid, accessible test email address.
4. Clicktheform's Submit button.

Step 7: Validation and Debugging Analysis

1. Verify the initial browser response to confirm the record was successfully added to the database.
2. Log into the target email client inbox.
3. Check the primary inbox and spam folder to confirm that the automated email with the subject line "TEST: Workflow Automation Is Working!" arrived successfully without system delay.

3. Output

Workflow Activation: The back-end automation trigger was successfully mapped to the Event Registration form's submission event without any compilation or system errors.

Script Validation: The written Deluge code passed Zoho Creator's logical syntax checks and successfully saved to the application architecture.

241401091

Live Execution Verification

- Filling out and submittingthe live user form correctly generated a new record database entry.
- The backend script triggered instantaneously upon form submission.
- A real-time, automated test confirmation email titled "TEST: Workflow Automation Is Working!" was successfully routed and delivered to the registered login inbox.

Result

The successful execution of this project conclusively demonstrates the power of low-code automation and multi-service architecture within the cloud ecosystem. By designing targeted backend workflows, utilizing advanced Deluge scripting syntax, and establishing secure API-driven integrations, the application has transitioned from a passive data repository into an active, intelligent management system.
