Integrating a Zoho Creator application with another Zoho service using connections and APIs

Event Registration Form — Zoho Calendar Integration Use Case

Samyuktha.b
241401091

1. Aim

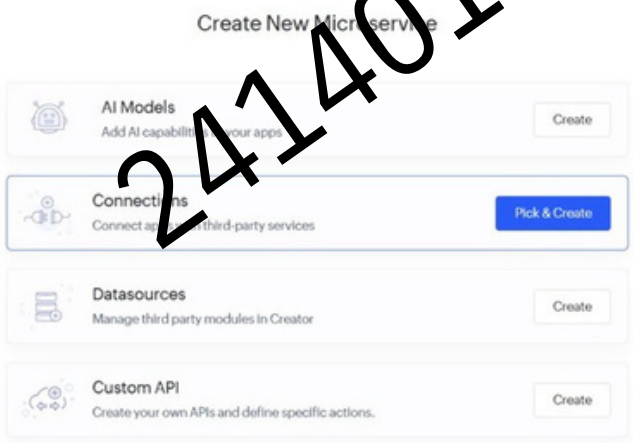

To integrate a Zoho Creator event registration form with Zoho Calendar using microservice connections, conditional workflows, and Deluge scripting.

2. Procedure

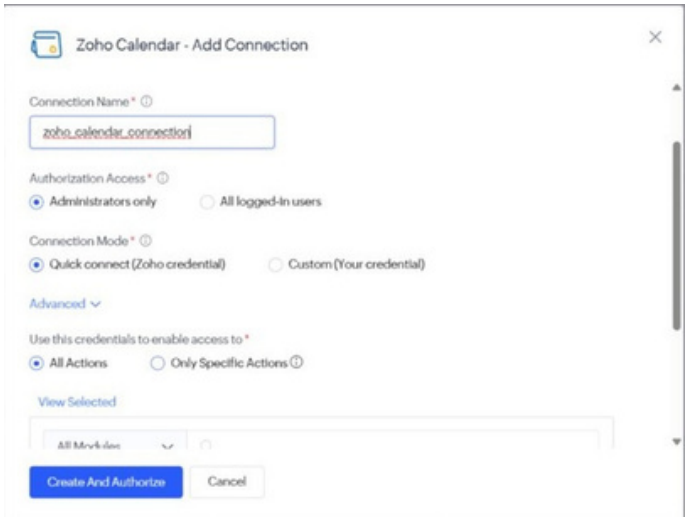

Phase A: Navigating to the Connection Panel

1. Logi n to yourZoho Creator developeraccount and open the active Event Registration & Participant Management application.
2. In the left navigation panel under the Develop section, click on Microservices to access the centralized integration environment.
3. Review the available options and choose Connections (Pick & Create) to configure the Zoho Calendar service bridge.

241401091

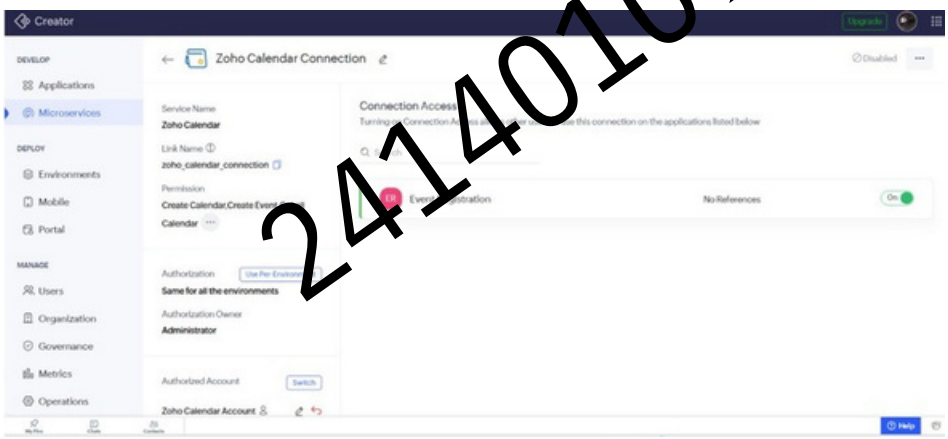

The Create New Microservice panel lists AI Models, Connections, Datasources, and Custom API; the Connections option (Connect apps with third-party services) is selected using Pick & Create.

The Zoho Calendar – Add Connection dialog with the connection name zoho_calendar_connection, Authorization Access set to Administrators only, Connection Mode set to Quick connect (Zoho credential), and access enabled for All Actions, followed by Create And Authorize.

Phase B: Verifying Scopes and Application References

4. Click directly on the Zoho Calendar Connection assetto open its security and permission settings dashboard.
5. In the left panel, inspect the assigned operational permissions to confirm API access capabilities (Create Calendar, Create Event, Get all Calendars).
6. In the main pane, verify that the application link for Event Registration is explicitly switched On under the Connection Access matrix.

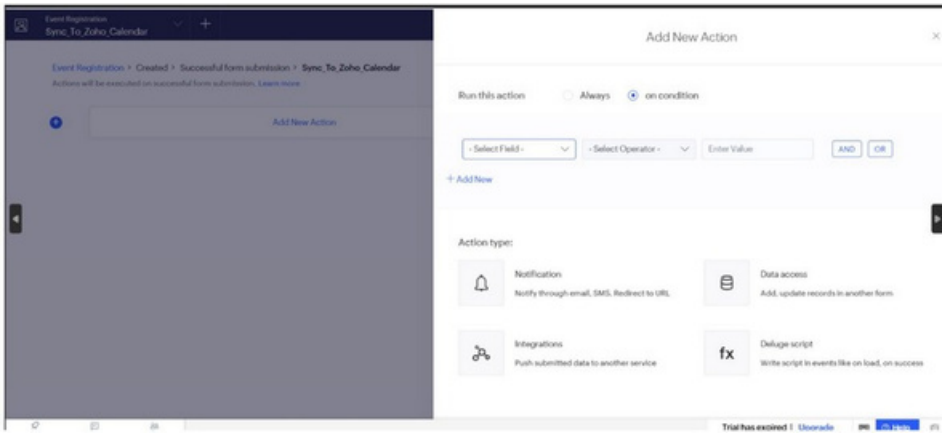

241401091

The Zoho Calendar Connection management panel showing the service name (Zoho Calendar), link name zoho_calendar_connection, the granted permissions, the authorization owner (Administrator), and the Event Registration application toggle set to On under Connection Access.

Phase C: Setting Up Conditional Rules

7. Navigate back tothe coreapplication, select the Event Registration form, and click on the Workflow tab in the top header.
8. Create a new form workflow named Sync_To_Zoho_Calendar structured to execute: Created > Successful form submission.
9. Inside the action builder, switch the run parameter from Always to on condition.
10. Open the field mapping tools to link the conditional gate. Choose the Agree_To_Code_Of_Conduct field, set the comparison operator to equals, and bind the value to the checkbox choice: 'I agree to the event code of conduct'.

The Add New Action panel for the Sync_To_Zoho_Calendar workflow (Event Registration > Created > Successful form submission), with Run this action set to on condition, the Select Field / Select Operator / Enter Value condition builder, and the available action types: Notification, Data access, Integrations, and Deluge script.

Phase D: Compiling the Deluge Script Code

11. Select Deluges cript (fx) from the Action type grid to open the embedded Deluge editor workspace.
12. Remove the template elements and insert the data map using the validated field tokens (input.email_address and input.event_track), along with the session date and slot fields.
13. Input the structured invokeurl task block targeting the Zoho Calendar API and reference the connection link name (zoho_calendar_connection).
14. Click the blue Save button in the bottom-right corner to run the compiler validation and save the script.

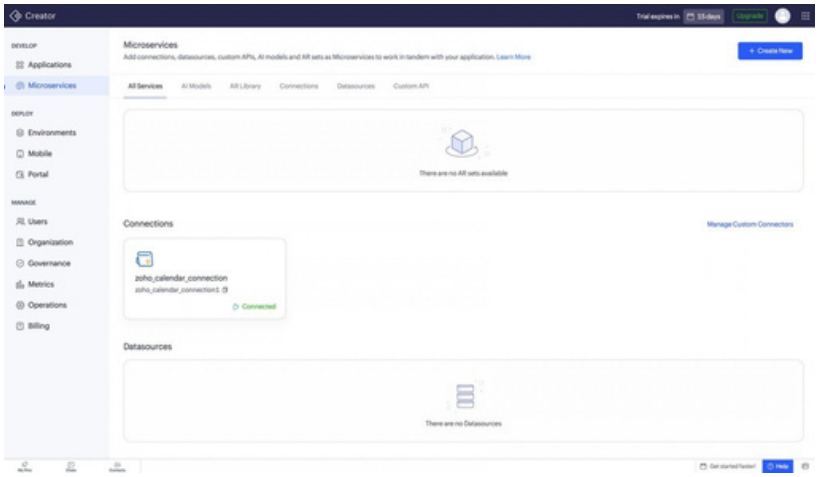

241401091

The Deluge Script editor for Sync_To_Zoho_Calendar. The script initializes an eventDetails map, maps the title (email address and event track), description, and date-time (Preferred_Session_Date and Preferred_Session_Slot), calls invokeurl with type POST using the connection zoho_calendar_connection, and traces the response using info.

3. Output & System Verification

The end-to-end integration architecture was successfully deployed within the application ecosystem. As verified in the main microservices interface, the Zoho Calendar API pipeline is established and operational.

- **Connection Diagnostic Result:** Connected (Green Status Verified)
- **Operational Availability:** The connection link name zoho_calendar_connection is fully compiled and active within the form's logic flow.

The Microservices dashboard (Connections tab) showing the Zoho Calendar Connection card with zoho_calendar_connection and a green Connected status, confirming the integration bridge is established.

4. Conclusion

The labexercisesuccessfully demonstrates how to connect a low-code application to external cloud services using microservices, conditional workflows, and custom Deluge scripting. By binding the Event Registration form criteria to the zoho_calendar_connection module, the project establishes a working proof-of-concept for automated workshop scheduling and seat blockouts on a master institutional schedule.
